

Geosites

- 1 **Río del Águila.** Along the river various lithological contacts (Yanhuitlán Formation, Toba Llano de Lobos, andesites and tuff) are exposed..

The river is located in an area of weakness associated with regional faults, which has given rise to the presence of multiple escarpments.

Different mass wasting processes such as landslides and mudslides can also be seen.

Oaxaca

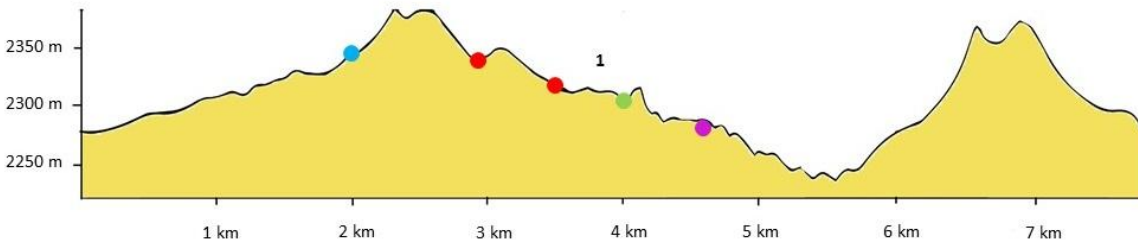

Geotrail Río del Águila

Length : 7.7 km

Min. Altitude : 2,200 m

Max. Altitude : 2,380 m

On this trail the youngest geological units of the Geopark are exposed (tuffs and andesites). Another attraction of the trail is vegetation, consisting of species typical of the region.
